

[METHOD OF REMOTELY MANAGING MOBILE COMMUNICATION DEVICE]

Abstract

A method of remotely managing a mobile communication device is provided. At least a short message having an application program is provided. Next, the application program is sent to the mobile communication device and the application program is run on the mobile communication device. The present invention utilizes the short message service to send the program code to the mobile communication device and runs the program on the mobile communication device. Hence, the present invention can achieve the objective of remotely managing the mobile communication device without additional hardware cost. In addition, by using the popular cross-platform program technology (e.g., J2ME), the remote management function can be achieved in different mobile communication device platforms without modifying the program code.
